We no longer build buildings like we used to nor do we pay for them in the same way. Buildings today are no longer only shelter but are also life support systems, communication terminals, data manufacturing centers, and much more. Buildings are incredibly expensive tools that must be constantly adjusted to function efficiently. The economics of building has become as complex as its design. When buildings were shelter they lasted longer than their builders. The average gothic master mason lived 35 or 40 years. Cathedrals took 3 or 4 hundred years to build. Cost estimates were verified by great great grandchildren of the original designer. Today, creative economics has become as important as creative design and creative building. The client brings builder, contractor, architect, and facilities manager to account in their life time. The cost of building can therefore no longer be left to chance or act of god. Solutions are no longer as ingeniously simple as those proposed by a Florentine builder early in the 15th century. He proposed to center the dome of S. Maria del Fiore on a great mound of earth mixed with pennies. When the job was done street urchins would carry away the dirt in their search for the pennies. This was a serious suggestion offered by an early construction manager before Brunelleschi solved the problem more sensibly.

Making the case that population growth does not hinder economic progress and that it eventually raises standards of living, Julian Simon became one of the most controversial figures in economics during the past decade. This book gathers a set of articles--theoretical, empirical, and policy analyses--written over the past twenty years, which examine the effects of population increase on various aspects of economic development in less-developed economies. The studies show that within a century, or even a quarter of a century, the positive benefits of additional people counterbalance the short-run costs. The process is as follows: increased numbers of consumers, and the resultant increase of total income, expand the demand for raw materials and finished products. The resulting actual and expected shortages force up prices of the natural resources. The increased prices trigger the search for new ways to satisfy the demand, and sooner or later new sources and

innovative substitutes are found. These new discoveries lead to cheaper natural resources than existed before this process began, leaving humanity better off than if the shortages had not appeared.
