Air Lubrication and Air Cavity Technology is a major development that has emerged in recent years as a means to reduce resistance and powering for many types of ships, and an efficient design for high speed marine vessels. This book introduces the mechanisms for boundary layer drag reduction and concepts studied in early research work. Air bubble and sheet lubrication for displacement vessels is outlined and the key projects introduced. Generation of low volume flow air cavities under the hull of displacement, semi displacement and planing vessels are introduced together with theoretical and empirical analysis and design methods. Resistance reduction, power reduction and fuel efficiency are covered for both displacement and high speed vessels. Air layer and air cavity effects on vessel static and dynamic stability are covered, linked to regulatory requirements such as IMO. Seaway motions and reduced impact load of high speed craft in waves are discussed including model test results. Integration of propulsion systems for optimum powering is summarized. A design proposal for a wave piercing air cavity craft is included in an appendix. A comprehensive listing of document resources and internet locations is provided for further research.

Wind Engineering 1983, Part A contains the proceedings of the Sixth International Conference on Wind Engineering, held in Gold Coast, Australia, on March 21-25, 1983 and in Auckland, New Zealand, on April 6-7, 1983 under the auspices of the International Association for Wind Engineering. The conference provided a forum for discussing topics related to wind energy and wind engineering, from wind characteristics and wind loading to full-scale measurement and modeling of buildings and other structures. Comprised of 36 chapters, this volume begins with an assessment of the wider application of reliability principles in the treatment of wind loading, paying particular attention to the influence of wind direction and the role of full-scale testing in reducing uncertainty. The reader is then introduced to wind characteristics, with emphasis on strong winds and tropical cyclones; wind loading of tall buildings and low-rise structures; and instrumentation and experimental techniques for wind loading.

The base balance technique for the determination of dynamic wind loads is described, along with a detailed design method for pneumatic tubing systems and a digital system for the measurement of wind effects on large structures. The final two chapters deal with active modeling of large-scale turbulence and selection of local peak pressure coefficients for wind tunnel studies of buildings. This monograph will be of interest to students, practitioners, and researchers concerned with wind energy and wind engineering.

The airplane has experienced phenomenal advancement in the twentieth century, changing at an exponential rate from the Wright brothers to the present day. In this ground breaking work based on new research, Dr John D. Anderson, Jr, a curator at the National Air and Space Museum, analyzes the historical development of the conceptual design process of the airplane. He aims to answer the question of whether airplane advancement has been driven by a parallel advancement in the intellectual methodology of conceptual airplane design. In doing so, Anderson identifies and examines six case histories of 'grand

industry strategies, and the increase in competitiveness through innovation. This book stems from a series of biennial conferences devoted to issues affecting air-transport provision in remoter regions that have been organized by the Centre for Air Transport in Remoter Regions at Cranfield University. The primary aim of the conferences has been to provide an opportunity for those responsible for operating, managing, regulating and financing air transport services and associated infrastructure in these areas to be informed of the latest best-practice initiatives, to contrast different policy approaches and to debate potential solutions to perennial problems. Remoter regions has been a neglected area of air transport, as much of the focus of public and media attention is on the larger airlines, airports and aircraft. While the number of large airports in the world is in the hundreds, there are many thousands of smaller airports providing communities all over the globe with vital air links. More often than not these services and the airports to which they are operated are loss making and require subsidies to sustain them. There are therefore many more interested parties involved in both providing and deciding issues relating to the provision of air transport in these situations, most especially central, regional and local governments who are charged with financing these activities. The book contains 17 chapters from experts in remote-region air transport, within the following 5 sections: - Key economic and socio-economic issues - Subvention mechanisms - Route development initiatives - Infrastructure provision - Issues affecting the provision of air services in remoter regions.
