Nimble Tongues is a collection of essays that continues Steven G. Kellman's work in the fertile field of translingualism, focusing on the phenomenon of switching languages. A series of investigations and reflections rather than a single thesis, the collection is perhaps more akin in its aims—if not accomplishment—to George Steiner's Extraterritorial: Papers on Literature and the Language Revolution or Umberto Eco's Travels in Hyperreality. Topics covered include the significance of translingualism; translation and its challenges; immigrant memoirs; the autobiographies that Ariel Dorfman wrote in English and Spanish, respectively; the only feature film ever made in Esperanto; Francesca Marciano, an Italian who writes in English; Jhumpa Lahiri, who has abandoned English for Italian; Ilan Stavans, a prominent translingual author and scholar; Hugo Hamilton, a writer who grew up torn among Irish, German, and English; Antonio Ruiz-Camacho, a Mexican who writes in English; and the Universal Declaration of Human Rights as a multilingual text.

Critical Code contemplates Department of Defense (DoD) needs and priorities for software research and suggests a research agenda and related actions. Building on two prior books--Summary of a Workshop on Software Intensive Systems and Uncertainty at Scale and Preliminary Observations on DoD Software Research Needs and Priorities--the present volume assesses the nature of the national investment in software research and, in particular, considers ways to revitalize the knowledge base needed to design, produce, and employ software-intensive systems for tomorrow's defense needs. Critical Code discusses four sets of questions: To what extent is software capability significant for the DoD? Is it becoming more or less significant and strategic in systems development? Will the advances in software producibility needed by the DoD emerge unaided from industry at a pace sufficient to meet evolving defense requirements? What are the opportunities for the DoD to make more effective use of emerging technology to improve software capability and software producibility? In which technology areas should the DoD invest in research to advance defense software capability and producibility?

Incidents involving rescue from road vehicles are dramatically increasing in frequency. There are some 3500 deaths on the road each year, with 35,000 serious injuries. Modern motor vehicles are becoming safer for occupants, due to advancement in technology, so persons are more likely to survive high impact speeds, but are also more likely to become entrapped. The Fire and Rescue Service, as the primary rescue service, requires national guidance to ensure a similar standard of response anywhere in the UK. This manual is designed to highlight current best practice with regard to vehicle rescue techniques and first responder trauma care. Each chapter forms an independent reference source, but the publication as a whole forms a complete guide. Chapters cover: vehicle design and construction; dealing with incidents; safety procedures; operational procedures; extrication equipment; medical considerations and trauma care; Integrated Personal Development System (I.P.D.S.). Appendices cover: Highways Agency/Fire and Rescue Service memorandum of understanding; training and general information; and emergency services personnel (ESP) aide mémoire. The CD-ROM, "Vehicle extrication techniques", is a multi-media guide to rescue tool handling and extrication techniques.

This accessible, practice-oriented and compact text provides a hands-on introduction to the principles of market research. Using the market research process as a framework, the authors explain how to collect and describe the necessary data and present the most important and frequently used quantitative analysis techniques, such as ANOVA, regression analysis, factor analysis, and cluster analysis. An explanation is provided of the theoretical choices a market researcher has to make with regard to each technique, as well as how these are translated into actions in IBM SPSS Statistics. This includes a discussion of what the outputs mean and how they should be interpreted from a market research perspective. Each chapter concludes with a case study that illustrates the process based on real-world data. A comprehensive web appendix includes additional analysis techniques, datasets, video files and case studies. Several mobile tags in the text allow readers to quickly browse related web content using a mobile device.

We know facts, but we also know how to do things. To know a fact is to know that a proposition is true. But does knowing how to ride a bike amount to knowledge of propositions? This is a challenging question and one that deeply divides the contemporary landscape. A Critical Introduction to Knowledge-How introduces, outlines, and critically evaluates various contemporary debates surrounding the nature of knowledge-how. Carter and Poston show that situating the debate over the nature of knowledge-how in other epistemological debates provides new ways to make progress. In particular, Carter and Poston explore the question of what knowledge-how involves, and how it might come apart from propositional knowledge, by engaging with key epistemological topics including epistemic luck, knowledge of language, epistemic value, virtue epistemology and social epistemology. New frontiers for research on knowledge-how are also explored relating to the internalism - externalism debate as well as embodied and extended knowledge. A Critical Introduction to Knowledge-How provides an accessible introduction to the main arguments in this important and thriving debate suited for undergraduates and postgraduates in philosophy and related areas. A strength of the book is its methodology which places a premium on placing the debates over knowledge-how in a broader conversation over the nature of knowledge. This book also offers an opinionated discussion of various lines of argument which will be of interest to professional philosophers as well.

Climate change is the greatest challenge facing humanity: drastic reduction of carbon emissions is vital if we are to avoid a catastrophe that devastates large parts of the world. Governments and businesses have been slow to act and individuals now need to take the lead. The Earth can absorb no more than 3 tonnes of carbon dioxide emissions each year for every person on the planet if we are to keep temperature and rainfall change within tolerable limits. Yet from cars and holiday flights to household appliances and the food on our plates, Western consumer lifestyles leave each of us responsible for over 12 tonnes of carbon dioxide a year - four times what the Earth can handle. Individual action is essential if we want to avoid climate chaos. How to Live a Low-Carbon Life shows how easy it is to take responsibility, providing the first comprehensive, one-stop reference guide to calculating your CO2 emissions and reducing them to a sustainable 3 tonnes a year.

Haynes manuals are written specifically for the do-it-yourselfer, yet are complete enough to be used by professional mechanics. From clones, family, abortion, terrorism, and the concept of the collective to economics, nuclear power, cap and trade, renewable energy, and the politics of climate change, Everest and Bedogne do something much needed and remarkably absent in today's media. They strip away the layers of liberal and conservative ideology to look at the most talked about topics of our time from the standpoint of what the politicians have forgotten--common sense. Brought to light by logic, history, and science, the book filters the issues that in today's world every citizen, student, and educator needs to understand through what we know to be sound--that which we have gained through our day-to-day trials--our all-too-often repressed ability to see things in a practical and matter-of-fact way.
